# (Important?) Missed Abstract Connections

- IFD (Fretwell 1972; Fretwell and Lucas 1969)  $\iff$  Optimal power dispatch (Bergen and Vittal 2000)

Economic dispatch problem:

$$\text{minimize } \sum_{i=1}^n C_i(P_i) \quad \text{subject to } \sum_{i=1}^n P_i = P$$

Pareto minimization of costs subject to conservation simplex.

Solution (from KKT) is an “upside-down” IFD:

$$\frac{dC_i(P_i)}{dP_i} = \lambda \quad \forall i \in \{1, 2, \dots, n\} \quad (\text{and truncate appropriately})$$

Equalization of marginal cost matches IFD equalization of suitability.

# (Important?) Missed Abstract Connections

- IFD (Fretwell 1972; Fretwell and Lucas 1969)  $\iff$  Optimal power dispatch (Bergen and Vittal 2000)

IFD as optimization problem (thought experiment):

$$\text{maximize } \sum_{i=1}^n \int_0^{x_i} s_i(y) dy \quad \text{subject to } \sum_{i=1}^n x_i = N$$

Pareto maximization of (???) subject to conservation simplex.

Right-side-up IFD:

$$s_i(x_i) = \lambda \quad \forall i \in \{1, 2, \dots, n\} \quad (\text{and truncate appropriately})$$

Distribute  $x_i$  to equalize suitability.

*[ Conical cost combination with simplex constraint set has simple solution in dual space (i.e., solve for  $\lambda$ ). ]*

## Introduction

Solitary foraging: from ecology to engineering and back

Speed choice (→)

Impulsiveness and operant conditioning (←)

Long patch residence times (←←)

Cooperative task processing

Closing remarks

- Nice homomorphism between solitary foragers and autonomous vehicles (Andrews *et al.* 2004; Charnov 1973; Quijano *et al.* 2006; Stephens and Krebs 1986)
- Vehicle speed choice is very similar to cryptic prey problem described by Gendron and Staddon (1983)
  - *Ceteris paribus*, encounter rate increases with search speed
  - Search cost increases with search speed
  - Detection mistakes may vary with speed
  - Non-trivial speed–prey choice coupling
    - Prey  $\implies$  speed  $\implies$  rate  $\implies$  prey

Bobwhite quail  
(Gendron and Staddon 1983)

# Foraging theory for speed choice

## Introduction

Solitary foraging: from ecology to engineering and back

Speed choice (→)

Impulsiveness and operant conditioning (←)

Long patch residence times (←←)

Cooperative task processing

Closing remarks

- Nice homomorphism between solitary foragers and autonomous vehicles (Andrews *et al.* 2004; Charnov 1973; Quijano *et al.* 2006; Stephens and Krebs 1986)
- Vehicle speed choice is very similar to cryptic prey problem described by Gendron and Staddon (1983)
- To match bobwhite quail observations, Gendron and Staddon choose detection function  $P_i^d(u) \triangleq (1 - (u/u_{\max})^{K_i})^{1/K_i}$  that maps search speed  $u \in [0, u_{\max}]$  to detection probability  $P_i^d$  for tasks of type  $i$  with conspicuousness  $K_i \in [0, \infty)$ .
  - No analytical tractability
  - Chose  $n = 2$  for simulation (1983)
  - $P_i^d$  is strange at bounds (1 and 0)

Les Howard  
Bobwhite quail  
(Gendron and Staddon 1983)

# On-line prey–speed choice for $n \in \mathbb{N}$ (Pavlic 2007; Pavlic and Passino 2009)

## Introduction

Solitary foraging: from ecology to engineering and back

Speed choice ( $\rightarrow$ )

Impulsiveness and operant conditioning ( $\leftarrow$ )

Long patch residence times ( $\leftarrow$ )

Cooperative task processing

Closing remarks

## ■ Autonomous vehicle faces $n$ -way merged Poisson process

- $\lambda_i$ : encounter rate for task of type  $i$
- $(g_i, t_i)$ : average (value, time) for processing task of type  $i$
- $p_i$ : probability that task of type  $i$  is processed (decision)
- $c^s$ : cost per-unit-time of searching

# On-line prey–speed choice for $n \in \mathbb{N}$ (Pavlic 2007; Pavlic and Passino 2009)

## Introduction

Solitary foraging: from ecology to engineering and back

Speed choice ( $\rightarrow$ )

Impulsiveness and operant conditioning ( $\leftarrow$ )

Long patch residence times ( $\leftarrow$ )

Cooperative task processing

Closing remarks

## ■ Autonomous vehicle faces $n$ -way merged Poisson process

- $\lambda_i$ : encounter rate for task of type  $i$
- $(g_i, t_i)$ : average (value, time) for processing task of type  $i$
- $p_i$ : probability that task of type  $i$  is processed (decision)
- $c^s$ : cost per-unit-time of searching

## ■ Vehicle goes through cycles of searching and processing

- $\bar{G}$ : average per-encounter gain
- $\bar{T}$ : average per-encounter search and processing time
- $\mathcal{G}(t)$ : Markov renewal–reward process for accumulated gain

# On-line prey–speed choice for $n \in \mathbb{N}$ (Pavlic 2007; Pavlic and Passino 2009)

## Introduction

Solitary foraging: from ecology to engineering and back

Speed choice ( $\rightarrow$ )

Impulsiveness and operant conditioning ( $\leftarrow$ )

Long patch residence times ( $\leftarrow$ )

Cooperative task processing

Closing remarks

## ■ Autonomous vehicle faces $n$ -way merged Poisson process

- $\lambda_i$ : encounter rate for task of type  $i$
- $(g_i, t_i)$ : average (value, time) for processing task of type  $i$
- $p_i$ : probability that task of type  $i$  is processed (decision)
- $c^s$ : cost per-unit-time of searching

## ■ Long runtime $\implies$ maximize rate of return

$$\text{aslim}_{t \rightarrow \infty} \frac{\mathcal{G}(t)}{t} = \frac{\bar{G}}{\bar{T}} = \frac{-c^s + \sum_{i=1}^n \lambda_i p_i g_i}{1 + \sum_{i=1}^n \lambda_i p_i t_i} \triangleq R(\mathbf{p})$$

As expected, **type-II** functional response (Holling's disk equation without any sandpaper disks).

# On-line prey–speed choice for $n \in \mathbb{N}$ (Pavlic 2007; Pavlic and Passino 2009)

## Introduction

Solitary foraging: from ecology to engineering and back

Speed choice (→)

Impulsiveness and operant conditioning (←)

Long patch residence times (←)

Cooperative task processing

Closing remarks

## ■ Autonomous vehicle faces $n$ -way merged Poisson process

- $\lambda_i$ : encounter rate for task of type  $i$
- $(g_i, t_i)$ : average (value, time) for processing task of type  $i$
- $p_i$ : probability that task of type  $i$  is processed (decision)
- $c^s$ : cost per-unit-time of searching

## ■ In general, $p_i \in [0, 1]$ , but

$$\frac{\partial R(\mathbf{p})}{\partial p_i} = \frac{\lambda_i g_i \left( 1 + \sum_{j=1}^n \lambda_j p_j t_j \right) - \lambda_i t_i \left( -c^s + \sum_{j=1}^n \lambda_j p_j g_j \right)}{\left( 1 + \sum_{i=1}^n \lambda_i p_i t_i \right)^2}$$

# On-line prey–speed choice for $n \in \mathbb{N}$ (Pavlic 2007; Pavlic and Passino 2009)

## Introduction

Solitary foraging: from ecology to engineering and back

Speed choice ( $\rightarrow$ )

Impulsiveness and operant conditioning ( $\leftarrow$ )

Long patch residence times ( $\leftarrow$ )

Cooperative task processing

Closing remarks

## ■ Autonomous vehicle faces $n$ -way merged Poisson process

- $\lambda_i$ : encounter rate for task of type  $i$
- $(g_i, t_i)$ : average (value, time) for processing task of type  $i$
- $p_i$ : probability that task of type  $i$  is processed (decision)
- $c^s$ : cost per-unit-time of searching

## ■ So KKT reveals optimization is purely $O(2^n)$ combinatorial

$$\frac{\partial R(\mathbf{p})}{\partial p_i} = \frac{\lambda_i g_i \left( 1 + \sum_{\substack{j=1 \\ j \neq i}}^n \lambda_j p_j t_j \right) - \lambda_i t_i \left( -c^s + \sum_{\substack{j=1 \\ j \neq i}}^n \lambda_j p_j g_j \right)}{\left( 1 + \sum_{i=1}^n \lambda_i p_i t_i \right)^2}$$

So-called *zero–one rule* because  $p_i^* \in \{0, 1\}$

# On-line prey–speed choice for $n \in \mathbb{N}$ (Pavlic 2007; Pavlic and Passino 2009)

## Introduction

Solitary foraging: from ecology to engineering and back

Speed choice ( $\rightarrow$ )

Impulsiveness and operant conditioning ( $\leftarrow$ )

Long patch residence times ( $\leftarrow$ )

Cooperative task processing

Closing remarks

## ■ Autonomous vehicle faces $n$ -way merged Poisson process

- $\lambda_i$ : encounter rate for task of type  $i$
- $(g_i, t_i)$ : average (value, time) for processing task of type  $i$
- $p_i$ : probability that task of type  $i$  is processed (decision)
- $c^s$ : cost per-unit-time of searching

## ■ So KKT reveals optimization is purely $O(2^n)$ combinatorial

$$\frac{\partial R(\mathbf{p})}{\partial p_i} = \frac{\lambda_i g_i \left( 1 + \sum_{\substack{j=1 \\ j \neq i}}^n \lambda_j p_j t_j \right) - \lambda_i t_i \left( -c^s + \sum_{\substack{j=1 \\ j \neq i}}^n \lambda_j p_j g_j \right)}{\left( \sum_{j=1}^n \lambda_j p_j \right)^2}$$

[ Sufficient condition; not necessary ]

So-called zero–one **rule** because  $p_i^* \in \{0, 1\}$

# On-line prey–speed choice for $n \in \mathbb{N}$ (Pavlic 2007; Pavlic and Passino 2009)

## Introduction

Solitary foraging: from ecology to engineering and back

Speed choice ( $\rightarrow$ )

Impulsiveness and operant conditioning ( $\leftarrow$ )

Long patch residence times ( $\leftarrow$ )

Cooperative task processing

Closing remarks

## ■ Autonomous vehicle faces $n$ -way merged Poisson process

- $\lambda_i$ : encounter rate for task of type  $i$
- $(g_i, t_i)$ : average (value, time) for processing task of type  $i$
- $p_i$ : probability that task of type  $i$  is processed (decision)
- $c^s$ : cost per-unit-time of searching

## ■ Classical prey ranking refines search from $O(2^n)$ to $O(n + 1)$

$$\underbrace{\frac{g_1}{t_1} > \frac{g_2}{t_2} > \dots > \frac{g_{k^*}}{t_{k^*}}}_{\text{Processed types } (p_i^* = 1)} > \underbrace{\frac{-c^s + \sum_{i=1}^{k^*} \lambda_i g_i}{1 + \sum_{i=1}^{k^*} \lambda_i t_i}}_{\text{Optimal rate } R(\mathbf{p}^*)} > \underbrace{\frac{g_{k^*+1}}{t_{k^*+1}} > \dots > \frac{g_n}{t_n}}_{\text{Ignored types } (p_i^* = 0)}$$

where optimal  $p_i^* = [i \leq k^*]$  with  $k^* \in \{0, 1, \dots, n\}$

# On-line prey–speed choice for $n \in \mathbb{N}$ (Pavlic 2007; Pavlic and Passino 2009)

## Introduction

Solitary foraging: from ecology to engineering and back

Speed choice ( $\rightarrow$ )

Impulsiveness and operant conditioning ( $\leftarrow$ )

Long patch residence times ( $\leftarrow$ )

Cooperative task processing

Closing remarks

## ■ Autonomous vehicle faces $n$ -way merged Poisson process

- $\lambda_i$ : encounter rate for task of type  $i$
- $(g_i, t_i)$ : average (value, time) for processing task of type  $i$
- $p_i$ : probability that task of type  $i$  is processed (decision)
- $c^s$ : cost per-unit-time of searching

## ■ Classical prey ranking **does not depend on $\lambda$ (i.e., speed)**

$$\underbrace{\frac{g_1}{t_1} > \frac{g_2}{t_2} > \dots > \frac{g_{k^*}}{t_{k^*}}}_{\text{Processed types } (p_i^* = 1)} > \underbrace{\frac{-c^s + \sum_{i=1}^{k^*} \lambda_i g_i}{1 + \sum_{i=1}^{k^*} \lambda_i t_i}}_{\text{Optimal rate } R(\mathbf{p}^*)} > \underbrace{\frac{g_{k^*+1}}{t_{k^*+1}} > \dots > \frac{g_n}{t_n}}_{\text{Ignored types } (p_i^* = 0)}$$

where optimal  $p_i^* = [i \leq k^*]$  with  $k^* \in \{0, 1, \dots, n\}$

# On-line prey–speed choice for $n \in \mathbb{N}$

## Effects of speed

### Introduction

Solitary foraging: from ecology to engineering and back

Speed choice ( $\rightarrow$ )

Impulsiveness and operant conditioning ( $\leftarrow$ )

Long patch residence times ( $\leftarrow$ )

Cooperative task processing

Closing remarks

- Speed  $u \in [u_{\min}, u_{\max}] \subset [0, \infty)$  influences each encounter rate

$$\lambda_i(u) = uD_iP_i^d(u)$$

where  $D_i$  is the linear density in the population

# On-line prey–speed choice for $n \in \mathbb{N}$

## Effects of speed

$$G_0(\mathbf{p}) \triangleq -c_a^s$$

are constant with respect to  $u$  (i.e., biquadratic ratio)

- Find optimal  $u^*$  for each  $\mathbf{p}^*$  candidate ( $n + 1$  total)

# On-line prey–speed choice for $n \in \mathbb{N}$

## Finding optimal speed

- Because biquadratic objective, for each  $\mathbf{p}^*$  candidate,

$$\frac{\partial R(u)}{\partial u} = \frac{(G_2 T_1 - G_1 T_2)u^2 + 2(G_2 - G_0 T_2)u + (G_1 - G_0 T_1)}{\left(T_2 u^2 + T_1 u + 1\right)^2}$$

By KKT, if quadratic numerator root  $u^* \in [u_{\min}, u_{\max}]$ , then  $u^*$  is optimal speed; otherwise, optimal speed  $u^* \in \{u_{\min}, u_{\max}\}$  based on sign of numerator

Closing remarks

A task-processing network is a directed graph:

- $\mathcal{A} \subset \mathbb{N}$ : Set of *task-processing agents*
- $\mathcal{P} \subseteq \{(i, j) \in \mathcal{A}^2 : i \neq j\}$ : Directed arcs connecting distinct agents
- $\mathcal{V}_i \triangleq \{j \in \mathcal{A} : (j, i) \in \mathcal{P}\}$ : Set of *conveyors* for each  $i \in \mathcal{A}$
- $\mathcal{C}_i \triangleq \{j \in \mathcal{A} : (i, j) \in \mathcal{P}\}$ : Set of *cooperators* for each  $i \in \mathcal{A}$
- $\mathcal{V} \triangleq \{j \in \mathcal{A} : \mathcal{C}_j \neq \emptyset\}$ : Set of all conveyors
- $\mathcal{C} \triangleq \{i \in \mathcal{A} : \mathcal{V}_i \neq \emptyset\}$ : Set of all cooperators

Task flows at each agent:

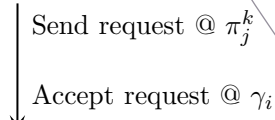

- $\mathcal{Y}_i \subset \mathbb{N}$ : Possibly empty set of *task types* that arrive at conveyor  $i \in \mathcal{A}$
- $\lambda_j^k \in \mathbb{R}_{>0}$ : Encounter rate of type- $k$  tasks at agent  $j \in \mathcal{A}$  (e.g., Poisson encounters)
- $\pi_j^k \in [0, 1]$ : Probability that conveyor  $j \in \mathcal{A}$  advertises an incoming  $k$ -type task to its connected cooperators  $\mathcal{C}_j$
- $\gamma_i \in [0, 1]$ : Probability that cooperator  $i \in \mathcal{A}$  volunteers for advertised task from one of its connected conveyors  $\mathcal{V}_i$  (collected in  $\gamma$ )

Solitary foraging: from ecology to engineering and back

Cooperative task processing

Background

Task-processing network

Cooperation game

Asynchronous convergence to cooperation

Results

Closing remarks

- Need to develop an agent-based metric of performance that catalyzes cooperation
- Following foraging example, define utility function  $U_i(\gamma)$  based on **rate of gain**

# Cooperation game

## Metrics of volunteering

Introduction

Solitary foraging: from ecology to engineering and back

Cooperative task processing

Background

Task-processing network

Cooperation game

Asynchronous convergence to cooperation

Results

Closing remarks

- Need to develop an agent-based metric of performance that catalyzes cooperation
- Following foraging example, define utility function  $U_i(\gamma)$  based on **rate of gain**
- To simplify presentation of combinatorial volunteering analysis, introduce SOBP and SOMS.

# Cooperation game

## Metrics of volunteering

- To simplify presentation of combinatorial volunteering analysis, introduce SOBP and SOMS.

- $\mathcal{I}$ : finite index set

- $\Omega \triangleq \{\gamma_i\}_{i \in \mathcal{I}}$ : indexed family with  $\gamma_i \in [0, 1]$  for each  $i \in \mathcal{I}$

For  $g, h \in \mathbb{N}$  and  $\Gamma \subseteq \mathcal{I}$ ,

$$\text{SOBP}_g(\Gamma) \triangleq \sum_{\ell=0}^{|\Gamma|} \frac{1}{g + \ell} \sum_{\substack{\mathcal{C} \subseteq \Gamma \\ |\mathcal{C}|=\ell}} \left( \left( \prod_{i \in \mathcal{C}} \gamma_i \right) \left( \prod_{k \in \Gamma - \mathcal{C}} (1 - \gamma_k) \right) \right)$$

$$\text{SOMS}_h(\Gamma) \triangleq \sum_{\ell=0}^{|\Gamma|} (-1)^\ell \frac{1}{h + \ell} \sum_{\substack{\mathcal{C} \subseteq \Gamma \\ |\mathcal{C}|=\ell}} \left( \prod_{i \in \mathcal{C}} \gamma_i \right)$$

Several useful relationships between SOBP and SOMS.

  - Homomorphisms are not always obvious and should not be forced
  
- Unifying principles are more valuable than mimicry
  - Catalyze interdisciplinary collaboration

Introduction

Solitary foraging: from ecology to engineering and back

Cooperative task processing

Closing remarks

- Both biology and engineering are full of interesting complex systems
  - Real-time implementations in one domain are intuitive and cognitively simple behaviors in another
  - Homomorphisms are not always obvious and should not be forced
  
- Unifying principles are more valuable than mimicry
  - Catalyze interdisciplinary collaboration
  - Inject new ideas

Introduction

Solitary foraging: from ecology to engineering and back
